

OPDC Imaging Data Inventory — Summary for Reference

Moad Hani · March 2026

Data shared by Tamir Einstein and Johannes Klein (OPDC).

| Dataset                    | Date     | Subjects                                                      | Measures                                                                                                                          | Status in pipeline                                                                                                    |
|----------------------------|----------|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| SWI nigrosome-1 (CSV)      | Jun 2021 | 158 total: 53 iPD, 43 HC, 59 RBD, 3 other                     | Ref_M, Ref_SD, SN mean intensity vol. L/R, SN mean intensity % vol. L/R                                                           | Integrated: merged with OPDC subtype assignments; ~10 iPD overlap after PPMI-profile matching                         |
| SWI follow-up flag         | Jun 2021 | 30 of 53 iPD flagged (follow_up_scan = 1)                     | Flag only; the file contains one row per subject with baseline measures. Follow-up <i>measures</i> are not included in this file. | Tamir confirmed (24 Mar 2026) that processed follow-up values exist but have not yet been shared                      |
| DaTscan quant. SUR (Excel) | May 2019 | 9 iPD (caudate + putamen R/L); 48 RBD (caudate + putamen R/L) | Striatal uptake ratios (new + old software for PD)                                                                                | Reviewed but not integrated into pipeline: 9 iPD insufficient for subtype-level analysis. 8 of 9 also in SWI dataset. |

**Note:** All values verified against the files received. The SWI measures are pre-processed derived metrics, not raw images (per Tamir’s confirmation). The DaTscan file contains quantitative uptake ratios processed via Hermes software. The 9th DaTscan iPD subject (JR459) is absent from the SWI file.
